The screenshot shows the NetBeans IDE with the **Bicycle** class open. The code defines a **Bicycle** class with attributes **cadence**, **gear**, and **speed**. It includes methods for **changeCadence**, **speedUp**, **changeGear**, and **printInfo**.

```

1  /**
2   *
3   * @author user
4   */
5   public class Bicycle {
6       int cadence, gear, speed;
7
8       void changeCadence(int cadence) {
9           cadence = cadence;
10        }
11        //Metode untuk mengubah cadence dengan input bernilai int.
12
13        void speedUp(int kecepatanambahan) {
14            cadence += kecepatanambahan;
15        }
16        //Metode untuk speed dengan input bernilai int.
17
18        void changeGear(int gigiakarang) {
19            gear = gigiakarang;
20        }
21        //Metode untuk changeGear dengan input bernilai int.
22
23        void printInfo() {
24            System.out.println(
25                "Cadence: " + cadence + "\n" +
26                "Speed Up: " + speed + "\n" +
27                "Gear: " + gear + "\n"
28            );
29        }
30    }
31    //Sebagai output dari method yang telah dibuat.
32  }
  
```

4.

5. Berikut adalah daftar metode yang didukung oleh kelas String:

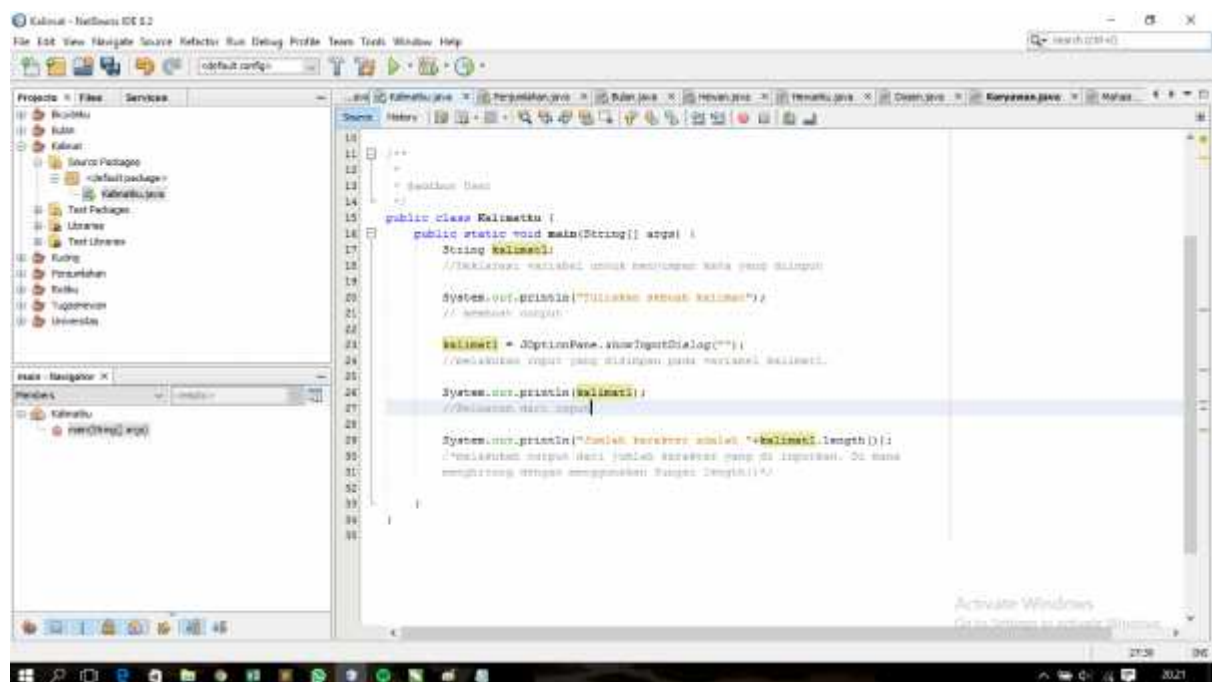

```

) Char charAt (int index)
) int compareTo (Object o)
) int compareTo (String anotherString)
) int compareToIgnoreCase (String str)
) String concat (String str)
) contentEquals boolean (StringBuffer sb)
) statis String copyValueOf (char [] data)
) statis String copyValueOf (char [] data, int offset, int count)
) boolean endsWith (String suffix)
) boolean equals (Object anObject)
) boolean equalsIgnoreCase (String anotherString):
) getBytes byte ()
) byte [] getBytes (String charsetName)
) int hashCode()
) int indexOf (int ch)
) int indexOf (int ch, int fromIndex)
) int indexOf (String str)
) int indexOf (String str, int fromIndex)
) String intern ()
) int lastIndexOf (int ch)
) int lastIndexOf (int ch, int fromIndex)
) int lastIndexOf (String str)
) int panjang ()
) String [] split (String regex)
) String [] split (String regex, batas int)
) boolean startsWith (String prefix, int toffset)
) String substring (int beginIndex)
) String substring (int beginIndex, int endIndex)
) char di [] toCharArray ()
) String toLowerCase ()
) String toLowerCase (lokal Lokal)
) String toString ()
) String toUpperCase ()
) String toUpperCase (lokal Lokal)
) String lis ()
) statis String valueOf (primitif tipe data x)

```
